

SPHERINA_AIR INSTRUCTION MANUAL – Supplement MAY 2021

This model includes technical-aesthetic innovations that modify its previous version.

Please read carefully this Supplement, to be considered complementary to the related Instruction Manual in force (here attached).

The two substantial innovations are the **hanging method** (ceiling anchoring) and the possibility of requesting the LED Light as an additional option.

HANGING SYSTEM

The new version is anchored to the ceiling with a steel cable, other than the acoustic-light cable.

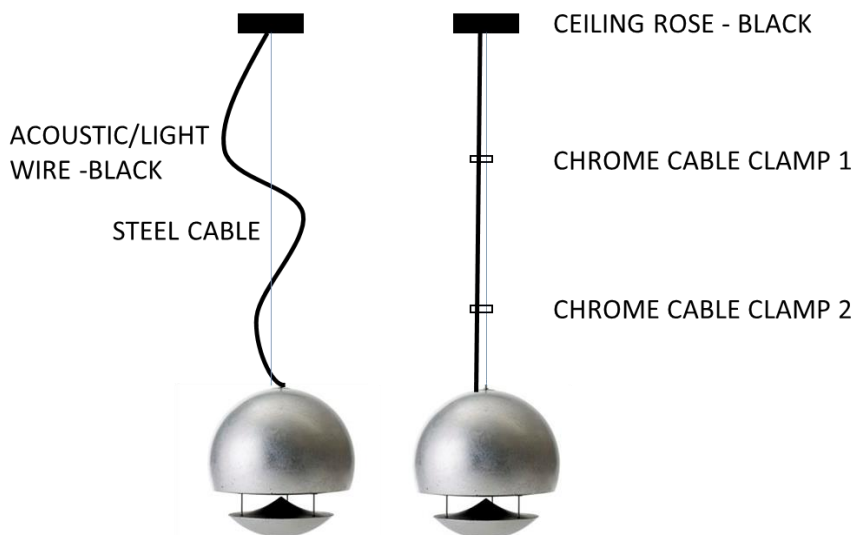

All the mechanical load (weight) is supported by such steel cable, which therefore must be perpendicular to the ceiling without any obstacle or without taking different paths. The acoustic-light cable, on the other hand, can be parallel to the steel cable or create some “aesthetic” loops. The number and type of loops is subjective (two specific stops are provided to ease this process).

Please be reminded that the provided (black) ceiling rose has an purely aesthetic function, as it hides the Spherina’s connection point.

The care and responsibility for how this 15 kg object is anchored to the ceiling (type of ceiling ring used to fasten the steel cable and how it is anchored to the ceiling itself) lies with the installer.

We provide you with a clamp (see instruction envelope), used to secure the steel cable to the wall ring.

Once finished, always check the safety of the installation with jerks and additional weights.

OPTIONAL LIGHT

If the model was requested with the Light option, a 24V dc power supply will be provided, which must be connected to the black cable according to the instructions

Never connect the Light cable of our model directly to the electrical socket!!!

During the acoustic-light connection process, be very careful to identify and not to confuse the pair of Light cables with the pair of the Audio cables (inside the black cable).
